Request for Proposals on Educational Modules for Sustainable Manufacturing

Recently, the NSF has funded a project titled: Sustainable Manufacturing Advances in Research and Technology (SMART) Coordination Network. The funding has been provided through the NSF Research Coordination Networks-Science, Engineering and Education for Sustainability (RCN-SEES) track. A primary objective of the project is to bridge the gap between the academic knowledge discovery and industrial technology innovation for sustainable manufacturing. Various research, educational, and outreach activities are underway. In the area of education, the project will generate a number of case study educational modules for sustainable engineering education that should be widely adoptable for undergraduate/graduate education and professional training in industries. Proposals are solicited from educators to develop modules on sustainable manufacturing case studies (SMCSs). An SMCS comprises both an interactive, graphically-oriented case study with supporting materials (e.g., data, models, simulations) that help the instructor and the student learn about some aspect of sustainable manufacturing design. A typical SMCS will have the following structure:

- Introduction and Background, describing the physical system represented by the case study and its importance. This includes basic concepts such as the relevant properties that appear as inputs or outputs of the manufacturing system.
- Engineering Principles and Models, providing a thorough overview of the fundamental principles and engineering models that exist, which may be applied to describe the process trade-offs.
- Problems, relevant to the case study and suitable for an instructor to assign as homework activities, focused on the connection between the sustainability and the manufacturing process.
- Design activity, which exposes the student to the use of an engineering model in a design setting. The activity would have the student use the model to develop a design related to the targeted systems and which meets sustainability metrics.

The SMCSs will be disseminated to the academic community and will be published using **CACHE** (**Computer Aids in Chemical Engineering**) resources (e.g., <u>http://cache.org/teaching-resources-center</u>).

It is expected that **four SMCSs will be developed annually**. **An honorarium of \$4,000** will be provided to the developer(s) of each SMCS.

Interested educators should **email a 3-page proposal (in pdf format) to<u>El-Halwagi@tamu.edu</u>. The proposal should include the following:**

• Proposal title, list of developers, affiliation, and contact information

• Introduction: giving a brief background, motivation for the SMCS, and relevance to sustainable manufacturing

- Problem statement: describing the scope of the problem/case study to be addressed
- Approach: highlighting the engineering principles to be used in constructing the SMCS
- Deliverables and timeline: describing format of the SMCS and associated materials
- Assessment plan

The **deadline for the proposals is November 15, 2012**. Selected proposals are to start on November 30, 2012 and are the deliverables are expected by May 1, 2013.

We look forward to hearing from you!

PI: Yinlun **Huang** (Wayne State University)

Co-PIs: Thomas F. **Edgar** (University of Texas), Mahmoud M.**El-Halwagi** (Texas A&M University), Cliff I. **Davidson** (Syracuse University), and Mario R.**Eden** (Auburn University)
